Sullivan West Elementary School

Lead Testing in School Drinking Water

8/31/23

Safe and healthy school environments can foster healthy and successful children. To protect public health, the Public Health Law and New York State Health Department (NYS DOH) regulations require that all public schools and BOCES test lead levels in water from every outlet that is being used, or could potentially be used, for drinking or cooking. If lead is found at any water outlet at levels above 5 parts per billion (ppb), which is equal to 5 micrograms per liter, the NYS DOH requires that the school take action to reduce the exposure to lead.

What is first draw testing of school drinking water for lead?

The “on again, off again” nature of water use at most schools can raise lead levels in school drinking water. Water that remains in pipes overnight, over a weekend, or over vacation periods stays in contact with lead pipes or lead solder and, as a result, could contain higher levels of lead. This is why schools are required to collect a sample after the water has been sitting in the plumbing system for a certain period of time. This “first draw” sample is likely to show higher levels of lead for that outlet than what you would see if you sampled after using the water continuously. However, even if the first draw sample does not reflect what you would see with continuous usage, it is still important because it can identify outlets that have elevated lead levels.

What are the results of the first draw testing?

Samples collected on: 8/8/23

Floor	Function/Space	Room	Fixture Type	Sample Results
'94 Bldg Lower Level	Girls Locker Room	Girls Locker Room	Water Fountain	5.83 ppb
'61 Bldg	Class Room	Room 137	Water Fountain	6.14 ppb
'61 Bldg	Class Room	Room 136	Water Fountain	11.5 ppb
'61 Bldg	Class Room	Room 135	Water Fountain	13.2 ppb
'61 Bldg	Class Room	Room 134	Water Fountain	10.2 ppb
'61 Bldg	Class Room	Room 132	Water Fountain	22.2 ppb
'61 Bldg	Class Room	Room 131	Water Fountain	7.01 ppb
'61 Bldg	Class Room	Room 129	Water Fountain	17.1 ppb

What is being done in response to the results?

Outlets that tested with lead levels above the action level of 5 ppb were removed from service. The water fountains located in the Girls Locker Room and Class Room 129 will have filters installed and will be re-tested at a later date. Until that time these outlets will remain closed. The remaining outlets that tested above the limit are capped and no longer in use. Outlets that tested below the action level remain in service with no restrictions. The full report listing all outlets tested is located on the school website.

What are the health effects of lead?

Lead is a metal that can harm children and adults when it gets into their bodies. Lead is a known neurotoxin, particularly harmful to the developing brain and nervous system of children under 6 years old. Lead can harm a young child's growth, behavior, and ability to learn. Lead exposure during pregnancy may contribute to low birth weight and developmental delays in infants. There are many sources of lead exposure in the environment, and it is important to reduce all lead exposure as much as possible. Water testing helps identify and correct possible sources of lead that contribute to exposure from drinking water.

What are the other sources of lead exposure?

Lead is a metal that has been used for centuries for many purposes, resulting in widespread distribution in the environment. Major sources of lead exposure include lead-based paint in older housing, and lead that built up over decades in soil and dust due to historical use of lead in gasoline, paint and manufacturing. Lead can also be found in a number of consumer products, including certain types of pottery, pewter, brass fixtures, foods, plumbing materials and cosmetics. Lead seldom occurs naturally in water supplies, but drinking water could become a possible source of lead exposure if the building's plumbing contains lead. The primary source of lead exposure for most children with elevated blood lead levels is lead based paint.

Should your child be tested for lead?

The risk to an individual child from past exposure to elevated lead in drinking water depends on many factors, including but not limited to, a child's age, weight, amount of water consumed, and the amount of lead in the water. Children may also be exposed to other significant sources of lead including paint, soil and dust. Since blood lead testing is the only way to determine a child's blood lead level, parents should discuss their child's health history with their child's physician to determine if blood lead testing is appropriate. Pregnant women or women of childbearing age should also consider discussing this matter with their physician.
